

## Features

- Serial Peripheral Interface (SPI) Compatible
- Supports SPI Modes 0 (0,0) and 3 (1,1)
  - Datasheet Describes Mode 0 Operation
- Low-voltage and Standard-voltage Operation
  - 2.7 ( $V_{CC} = 2.7V$  to 5.5V)
  - 1.8 ( $V_{CC} = 1.8V$  to 5.5V)
- 20 MHz Clock Rate (5V)
- 32-byte Page Mode
- Block Write Protection
  - Protect 1/4, 1/2, or Entire Array
- Write Protect (WP) Pin and Write Disable Instructions for Both Hardware and Software Data Protection
- Self-timed Write Cycle (5 ms max)
- High Reliability
  - Endurance: One Million Write Cycles
  - Data Retention: 100 Years
- Available in Automotive
- 8-lead JEDEC PDIP, 8-lead JEDEC SOIC, 8-lead TSSOP, 8-lead MAP, 8-lead Ultra Thin Mini-MAP (MLP 2x3) and 8-lead TSSOP Packages
- Die Sales: Wafer Form, Tape and Reel, and Bumped Wafers

## Description

The AT25080A/160A/320A/640A provides 8192/16384/32768/65536 bits of serial electrically-erasable programmable read-only memory (EEPROM) organized as 1024/2048/4096/8192 words of 8 bits each. The device is optimized for use in many industrial and commercial applications where low-power and low-voltage operation are essential. The AT25080A/160A/320A/640A is available in space-saving 8-lead PDIP, 8-lead JEDEC SOIC, 8-lead MAP, 8-lead Ultra Thin Mini-MAP (MLP 2x3), 8-lead TSSOP and 8-Lead Ultra Leadframe Land Grid Array (ULLGA) packages.

The AT25080A/160A/320A/640A is enabled through the Chip Select pin ( $\overline{CS}$ ) and accessed via a three-wire interface consisting of Serial Data Input (SI), Serial Data Output (SO), and Serial Clock (SCK). All programming cycles are completely self-timed, and no separate erase cycle is required before write.

## SPI Serial EEPROMs

**8K (1024 x 8)**

**AT25160A**

**AT25320A**

**AT25640A**

Table 0-1. Pin Configuration

| Pin Name          | Function              |
|-------------------|-----------------------|
| $\overline{CS}$   | Chip Select           |
| SCK               | Serial Data Clock     |
| SI                | Serial Data Input     |
| SO                | Serial Data Output    |
| GND               | Ground                |
| VCC               | Power Supply          |
| $\overline{WP}$   | Write Protect         |
| $\overline{HOLD}$ | Suspends Serial Input |
| NC                | No Connect            |
| DC                | Don't Connect         |

Block write protection is enabled by programming the status register with one of four blocks of write protection. Separate program enable and program disable instructions are provided for additional data protection. Hardware data protection is provided via the  $\overline{WP}$  pin to protect against inadvertent write attempts to the status register. The  $\overline{HOLD}$  pin may be used to suspend any serial communication without resetting the serial sequence.

1. Absolute Maximum Ratings\*

|                                                    |                 |
|----------------------------------------------------|-----------------|
| Operating Temperature.....                         | -55°C to +125°C |
| Storage Temperature .....                          | -65°C to +150°C |
| Voltage on Any Pin<br>with Respect to Ground ..... | -1.0V to +7.0V  |
| Maximum Operating Voltage .....                    | 6.25V           |
| DC Output Current.....                             | 5.0 mA          |

**\*NOTICE:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 1-1. Block Diagram

Table 1-1. Pin Capacitance<sup>(1)</sup>  
Applicable over recommended operating range from T<sub>A</sub> = 25°C, f = 1.0 MHz, V<sub>CC</sub> = +5.0V (unless otherwise noted)

| Symbol           | Test Conditions                                                                      | Max | Units | Conditions            |
|------------------|--------------------------------------------------------------------------------------|-----|-------|-----------------------|
| C <sub>OUT</sub> | Output Capacitance (SO)                                                              | 8   | pF    | V <sub>OUT</sub> = 0V |
| C <sub>IN</sub>  | Input Capacitance ( $\overline{\text{CS}}$ , SCK, SI, $\overline{\text{WP}}$ , HOLD) | 6   | pF    | V <sub>IN</sub> = 0V  |

Note: 1. This parameter is characterized and is not 100% tested.

**Table 1-2.** DC Characteristics

Applicable over recommended operating range from:  $T_{AI} = -40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ,  $V_{CC} = +1.8\text{V}$  to  $+5.5\text{V}$  (unless otherwise noted)

| Symbol         | Parameter           | Test Condition                                                                          | Min                                | Typ   | Max                 | Units         |
|----------------|---------------------|-----------------------------------------------------------------------------------------|------------------------------------|-------|---------------------|---------------|
| $V_{CC1}$      | Supply Voltage      |                                                                                         | 1.8                                |       | 5.5                 | V             |
| $V_{CC2}$      | Supply Voltage      |                                                                                         | 2.7                                |       | 5.5                 | V             |

Note: 1. This parameter is characterized and is not 100% tested.

KTTIC

## 2. Serial Interface Description

**MASTER:** The device that generates the serial clock.

**SLAVE:** Because the Serial Clock pin (SCK) is always an input, the AT25080A/160A/320A/640A always operates as a slave.

**TRANSMITTER/RECEIVER:** The AT25080A/160A/320A/640A has separate pins designated for data transmission (SO) and reception (SI).

**MSB:** The Most Significant Bit (MSB) is the first bit transmitted and received.

**SERIAL OP-CODE:** After the device is selected with  $\overline{CS}$  going low, the first byte will be received. This byte contains the op-code that defines the operations to be performed.

**INVALID OP-CODE:** If an invalid op-code is received, no data will be shifted into the AT25080A/160A/320A/640A, and the serial output pin (SO) will remain in a high impedance state until the falling edge of  $\overline{CS}$  is detected again. This will reinitialize the serial communication.

**CHIP SELECT:** The AT25080A/160A/320A/640A is selected when the  $\overline{CS}$  pin is low. When the device is not selected, data will not be accepted via the SI pin, and the serial output pin (SO) will remain in a high impedance state.

**HOLD:** The  $\overline{HOLD}$  pin is used in conjunction with the  $\overline{CS}$  pin to select the AT25080A/160A/320A/640A. When the device is selected and a serial sequence is underway,  $\overline{HOLD}$  can be used to pause the serial communication with the master device without resetting the serial sequence. To pause, the  $\overline{HOLD}$  pin must be brought low while the SCK pin is low. To resume serial communication, the  $\overline{HOLD}$  pin is brought high while the SCK pin is low (SCK may still toggle during  $\overline{HOLD}$ ). Inputs to the SI pin will be ignored while the SO pin is in the high impedance state.

**WRITE PROTECT:** The write protect pin ( $\overline{WP}$ ) will allow normal read/write operations when held high. When the  $\overline{WP}$  pin is brought low and WPEN bit is "1", all write operations to the status register are inhibited.  $\overline{WP}$  going low while  $\overline{CS}$  is still low will interrupt a write to the status register. If the internal write cycle has already been initiated,  $\overline{WP}$  going low will have no effect on any write operation to the status register. The  $\overline{WP}$  pin function is blocked when the WPEN bit in the status register is "0". This will allow the user to install the AT25080A/160A/320A/640A in a system with the  $\overline{WP}$  pin tied to ground and still be able to write to the status register. All  $\overline{WP}$  pin functions are enabled when the WPEN bit is set to "1".

Figure 2-1. SPI Serial Interface

### 3. Functional Description

The AT25080A/160A/320A/640A is designed to interface directly with the synchronous serial peripheral interface (SPI) of the 6805 and 68HC11 series of microcontrollers.

The AT25080A/160A/320A/640A utilizes an 8-bit instruction register. The list of instructions and their operation codes are contained in Table 3-1. All instructions, addresses, and data are transferred with the MSB first and start with a high-to-low CS transition.

**Table 3-1.** Instruction Set for the AT25080A/160A/320A/640A

| Instruction Name | Instruction Format | Operation                   |
|------------------|--------------------|-----------------------------|
| WREN             | 0000 X110          | Set Write Enable Latch      |
| WRDI             | 0000 X100          | Reset Write Enable Latch    |
| RDSR             | 0000 X101          | Read Status Register        |
| WRSR             | 0000 X001          | Write Status Register       |
| READ             | 0000 X011          | Read Data from Memory Array |
| WRITE            | 0000 X010          | Write Data to Memory Array  |

**WRITE ENABLE (WREN):** The device will power up in the write disable state when  $V_{CC}$  is applied. All programming instructions must therefore be preceded by a Write Enable instruction.

**WRITE DISABLE (WRDI):** To protect the device against inadvertent writes, the Write Disable instruction disables all programming modes. The WRDI instruction is independent of the status of the  $\overline{WP}$  pin.

**READ STATUS REGISTER (RDSR):** The Read Status Register instruction provides access to the status register. The READY/BUSY and Write Enable status of the device can be determined by the RDSR instruction. Similarly, the Block Write Protection Bits indicate the extent of protection employed. These bits are set by using the WRSR instruction.

**Table 3-2.** Status Register Format

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0            |
|-------|-------|-------|-------|-------|-------|-------|------------------|
| WPEN  | X     | X     | X     | BP1   | BP0   | WEN   | $\overline{RDY}$ |

**Table 3-3.** Read Status Register Bit Definition

| Bit                                                              | Definition                                                                                                                   |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Bit 0 ( $\overline{\text{RDY}}$ )                                | Bit 0 = "0" ( $\overline{\text{RDY}}$ ) indicates the device is READY. Bit 0 = "1" indicates the write cycle is in progress. |
| Bit 1 (WEN)                                                      | Bit 1 = "0" indicates the device is not WRITE ENABLED. Bit 1 = "1" indicates the device is write enabled.                    |
| Bit 2 (BP0)                                                      | See Table 3-4 on page 10.                                                                                                    |
| Bit 3 (BP1)                                                      | See Table 3-4 on page 10.                                                                                                    |
| Bits 4–6 are "0"s when device is not in an internal write cycle. |                                                                                                                              |
| Bit 7 (WPEN)                                                     | See Table 3-5 on page 11.                                                                                                    |
| Bits 0–7 are "1"s during an internal write cycle.                |                                                                                                                              |

**WRITE STATUS REGISTER (WRSR):** The WRSR instruction allows the user to select one of four levels of protection. The AT25080A/160A/320A/640A is divided into four array segments. One-quarter, one-half, or all of the memory segments can be protected. Any of the data within any selected segment will therefore be read only. The block write protection levels and corresponding status register control bits are shown in Table 3-4.

The three bits BP0, BP1, and WPEN are nonvolatile cells that have the same properties and functions as the regular memory cells (e.g., WREN,  $t_{WC}$ , RDSR).

**Table 3-4.** Block Write Protect Bits

| Level  | Status Register Bits |     | Array Addresses Protected |               |               |               |
|--------|----------------------|-----|---------------------------|---------------|---------------|---------------|
|        | BP1                  | BP0 | AT25080A                  | AT25160A      | AT25320A      | AT25640A      |
| 0      | 0                    | 0   | None                      | None          | None          | None          |
| 1(1/4) | 0                    | 1   | 0300<br>–03FF             | 0600<br>–07FF | 0C00<br>–0FFF | 1800<br>–1FFF |
| 2(1/2) | 1                    | 0   | 0200<br>–03FF             | 0400<br>–07FF | 0800<br>–0FFF | 1000<br>–1FFF |
| 3(All) | 1                    | 1   | 0000<br>–03FF             | 0000<br>–07FF | 0000<br>–0FFF | 0000<br>–1FFF |

The WRSR instruction also allows the user to enable or disable the write protect ( $\overline{\text{WP}}$ ) pin through the use of the Write Protect Enable (WPEN) bit. Hardware write protection is enabled when the  $\overline{\text{WP}}$  pin is low and the WPEN bit is "1". Hardware write protection is disabled when either the  $\overline{\text{WP}}$  pin is high or the WPEN bit is "0". When the device is hardware write protected, writes to the status register, including the block protect bits and the WPEN bit, and the block-protected sections in the memory array are disabled. Writes are only allowed to sections of the memory that are not block-protected.

**NOTE:** When the WPEN bit is hardware write protected, it cannot be changed back to "0" as long as the  $\overline{\text{WP}}$  pin is held low.

**Table 3-5.** WPEN Operation

| WPEN | $\overline{WP}$ | WEN | Protected Blocks | Unprotected Blocks | Status Register |
|------|-----------------|-----|------------------|--------------------|-----------------|
| 0    | X               | 0   | Protected        | Protected          | Protected       |
| 0    | X               | 1   | Protected        | Writeable          | Writeable       |
| 1    | Low             | 0   | Protected        | Protected          | Protected       |
| 1    | Low             | 1   | Protected        | Writeable          | Protected       |
| X    | High            | 0   | Protected        | Protected          | Protected       |
| X    | High            | 1   | Protected        | Writeable          | Writeable       |

**READ SEQUENCE (READ):** Reading the AT25080A/160A/320A/640A via the Serial Output (SO) pin requires the following sequence. After the  $\overline{CS}$  line is pulled low to select a device, the read op-code is transmitted via the SI line followed by the byte address to be read (A15–A0, see Table 3-6). Upon completion, any data on the SI line will be ignored. The data (D7–D0) at the specified address is then shifted out onto the SO line. If only one byte is to be read, the  $\overline{CS}$  line should be driven high after the data comes out. The read sequence can be continued since the byte address is automatically incremented and data will continue to be shifted out. When the highest address is reached, the address counter will roll over to the lowest address allowing the entire memory to be read in one continuous read cycle.

**WRITE SEQUENCE (WRITE):** In order to program the AT25080A/160A/320A/640A, two separate instructions must be executed. First, the device **must be write enabled** via the WREN instruction. Then a write (WRITE) instruction may be executed. Also, the address of the memory location(s) to be programmed must be outside the protected address field location selected by the block write protection level. During an internal write cycle, all commands will be ignored except the RDSR instruction.

A write instruction requires the following sequence. After the  $\overline{CS}$  line is pulled low to select the device, the WRITE op-code is transmitted via the SI line followed by the byte address (A15–A0) and the data (D7–D0) to be programmed (see Table 3-6). Programming will start after the  $\overline{CS}$  pin is brought high. The low-to-high transition of the  $\overline{CS}$  pin must occur during the SCK low-time immediately after clocking in the D0 (LSB) data bit.

The READY/BUSY status of the device can be determined by initiating a read status register (RDSR) instruction. If Bit 0 = “1”, the write cycle is still in progress. If Bit 0 = “0”, the write cycle has ended. Only the RDSR instruction is enabled during the write programming cycle.

The AT25080A/160A/320A/640A is capable of a 32-byte page write operation. After each byte of data is received, the five low-order address bits are internally incremented by one; the high-order bits of the address will remain constant. If more than 32 bytes of data are transmitted, the address counter will roll over and the previously written data will be overwritten. The AT25080A/160A/320A/640A is automatically returned to the write disable state at the completion of a write cycle.

**NOTE:** If the device is not write-enabled ( $\overline{WREN}$ ), the device will ignore the write instruction and will return to the standby state, when  $\overline{CS}$  is brought high. A new  $\overline{CS}$  falling edge is required to reinitiate the serial communication.

Table 3-6. Address Key

| Address         | AT25080A        | AT25160A        | AT25320A        | AT25640A        |
|-----------------|-----------------|-----------------|-----------------|-----------------|
| $A_N$           | $A_9-A_0$       | $A_{10}-A_0$    | $A_{11}-A_0$    | $A_{12}-A_0$    |
| Don't Care Bits | $A_{15}-A_{10}$ | $A_{15}-A_{11}$ | $A_{15}-A_{12}$ | $A_{15}-A_{13}$ |

Notes:

- 1. For 2.7V devices used in the 4.5 to 5.5V range, please refer to performance values in the AC and DC Characteristics tables.
- 2. “U” designates Green package + RoHS compliant.
- 3. “H” designates Green package + RoHS compliant, with NiPdAu Lead Finish.
- 4. Available in waffle pack and wafer form; order as SL788 for inkless wafer form. Bumped die available upon request. Please contact Serial EEPROM Marketing.

| Package Type |                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------|
| 8P3          | 8-lead, 0.300" Wide, Plastic Dual Inline Package (PDIP)                                                     |
| 8S1          | 8-lead, 0.150" Wide, Plastic Gull Wing Small Outline (JEDEC SOIC)                                           |
| 8A2          | 8-lead, 4.4 mm Body, Plastic Thin Shrink Small Outline Package (TSSOP)                                      |
| 8Y1          | 8-lead, 4.90 mm x 3.00 mm Body, Dual Footprint, Non-leaded, Miniature Array Package (MAP)                   |
| 8Y6          | 8-lead, 2.00 mm x 3.00 mm Body, 0.50 mm Pitch, Ultra Thin Mini-MAP, Dual No Lead Package (DFN), (MLP 2x3mm) |
| Options      |                                                                                                             |

Notes: 1. For 2.7V devices used in the 4.5 to 5.5V range, please refer to performance values in the AC and DC Characteristics tables.  
2. “U” designates Green package + RoHS compliant.  
3. “H” designates Green package + RoHS compliant, with NiPdAu Lead Finish.  
4. Available in waffle pack and wafer form; order as SL788 for inkless wafer form. Bumped die available upon request. Please contact Serial EEPROM Marketing.
