## Advanced 1A Linear Charge Management Controllers

### DESCRIPTION

The EUP8057 is a highly advanced Lithium-Ion (Li-Ion) and Lithium-Polymer (Li-Pol) linear charge management controller for use in cost sensitive and portable applications. It combines high accuracy constant-current and constant-voltage regulation, cell preconditioning, temperature monitoring, automatic charge termination, charge-status indication, in a space-saving MSOP-8, TSSOP-8 package.

The EUP8057 applies a constant current up to 1A to the battery and the charge current can be programmed externally with a sense-resistor.

The EUP8057 automatically terminates the charge cycle when the charge current drops to the charge termination threshold ( $I_{TERM}$ ) after the charge-regulation voltage is reached.

When the input supply is removed, the EUP8057 automatically enters a low-power sleep mode.

A battery charge state output pin is provided to indicate battery charge status through a display LED. The battery charge status output is a serial interface which may also be read by a system microcontroller.

### FEATURES

- 4.5V-15V Wide Input Voltage Range
- Ideal for Single Cell (4.1V or 4.2V) and Dual-Cell (8.2V or 8.4V) Li-Ion or Li-Pol Batteries
- Preset Charge Voltage with  $\pm 1\%$  Accuracy
- Programmable Charge Current up to 1A
- Constant-Current/Constant Voltage Operation
- Preconditioning of Low Voltage Cells
- Optional Cell-Temperature Monitoring Before and During Charge
- Charge Status Output for Single of Dual Led or Host Processor Interface
- Automatic Battery Recharge
- Charge Termination by Minimum Current
- Automatic Low-Power Sleep Mode When Input Power is Removed
- Available in TSSOP-8, MSOP-8 and SOP-8 Package
- RoHS Compliant and 100% Lead (Pb)-Free

### APPLICATIONS

- Cellular Phones / PDAs/ MP3 Players/DSC
- Handheld Instruments

Typical Operating Characteristics

Application Information

Functional Description

The EUP8057 is an advanced 1A linear charge controller for single or two-cell Li-Ion or Li-Pol applications. Refer to Blocking Diagram (Figure3) and Operation Flow Chart (Figure4) in this section.

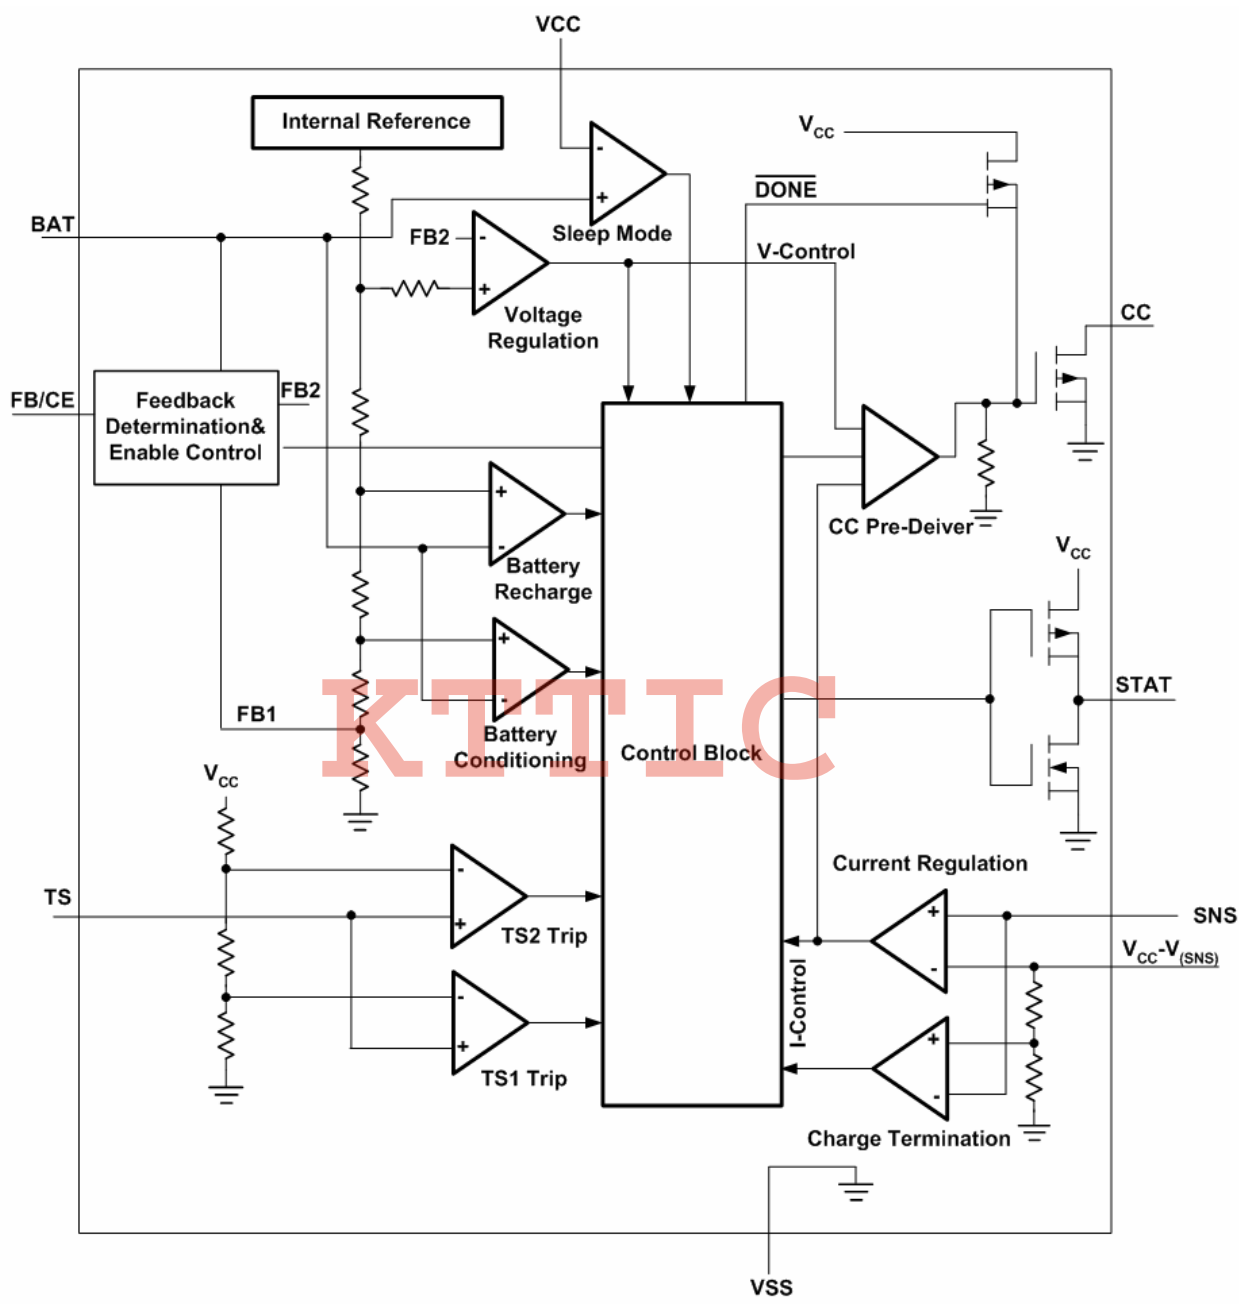

Figure3. Block Diagram

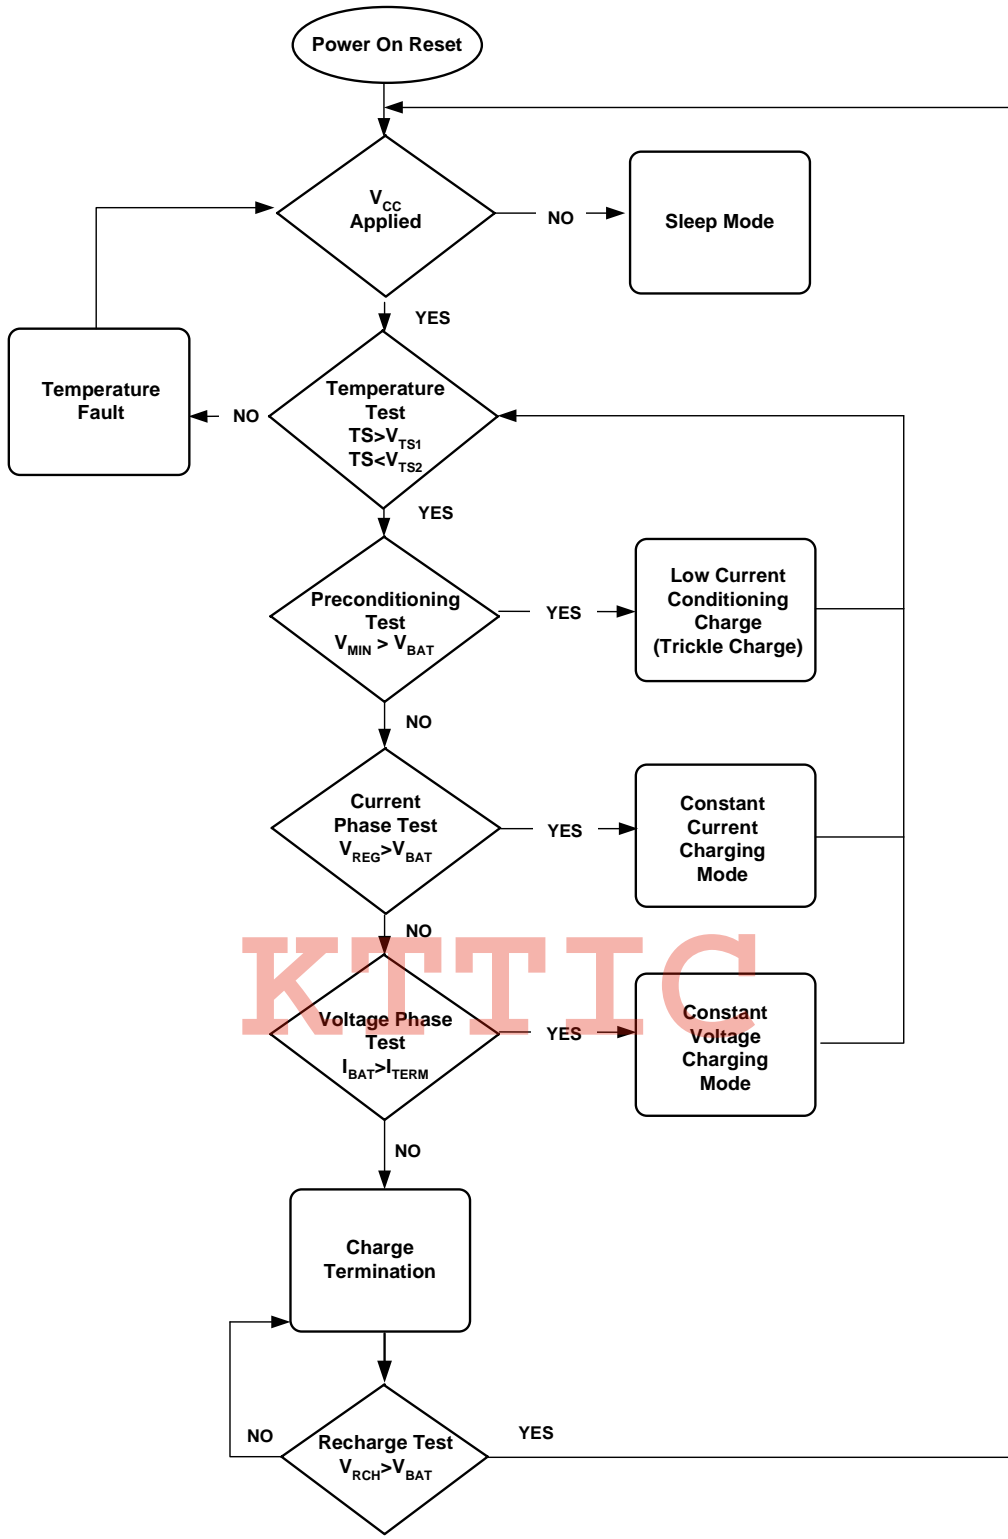

Figure4. Operation Flow Chart

**Qualification and Precharge**

When power is applied, the EUP8057 starts a charge-cycle if a battery is already present or when a battery is inserted. Charge qualification is based on battery temperature and voltage.

The EUP8057 suspends charge if the battery temperature is outside the  $V_{(TS1)}$  to  $V_{(TS2)}$  range and suspends charge until the battery temperature is within the allowed range. The EUP8057 also checks the battery voltage. If the battery voltage is below the precharge threshold  $V_{(min)}$ , the EUP8057 uses precharge to condition the battery. The conditioning charge rate  $I_{(PRECHG)}$  is set at approximately 10% of the regulation current. The conditioning current also minimizes heat dissipation in the external pass-element during the initial stage of charge. See Figure5 for a typical charge-profile.

Figure6. Current Sensing Circuit

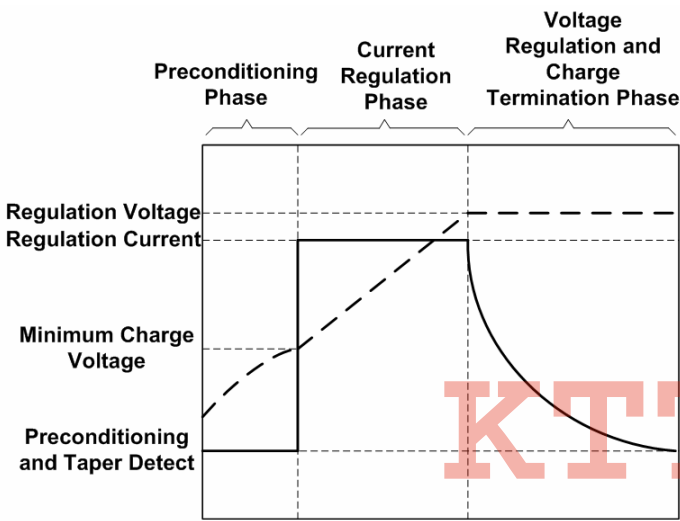

Figure5. Typical Charge Profile

**Voltage Regulation Phase**

The voltage regulation feedback is through the BAT pin. This input is tied directly to the positive side of the battery pack. The EUP8057 monitors the battery-pack voltage between the BAT and VSS pins. The EUP8057 is offered in five fixed-voltage versions:4.1V, 4.2V ,8.2V, 8.3V and 8.4V.

**FB/CE Pin Function**

This pin has two functions, one is to enable/disable the charge function, and the other is to finely adjust battery regulation voltage. Connect this pin to VDD to enable EUP8057, and connect to ground to disable it (Figure7). If this pin is connected to a voltage divider as shown in Figure8, it can be a 4.3V reference voltage to adjust the output regulation voltage as desired.

**Current Regulation Phase**

The EUP8057 regulates current while the battery-pack voltage is less than the regulation voltage,  $V_{O(REG)}$ . The EUP8057 monitors charge current at the SNS input by the voltage drop across a sense-resistor,  $R_{SNS}$ , in series with the battery pack. In current sensing configuration (Figure6),  $R_{SNS}$  is between the VCC and SNS pins, charge-current feedback, applied through pin SNS, maintains a voltage of  $V_{(SNS)}$  across the current sense resistor. The following formula calculates the value of the sense resistor:

$$R_{SNS} = \frac{V_{(SNS)}}{I_{O(REG)}} \quad \text{----- (1)}$$

Where  $I_{O(REG)}$  is the desired charging current.

Figure7. For CE pin Function

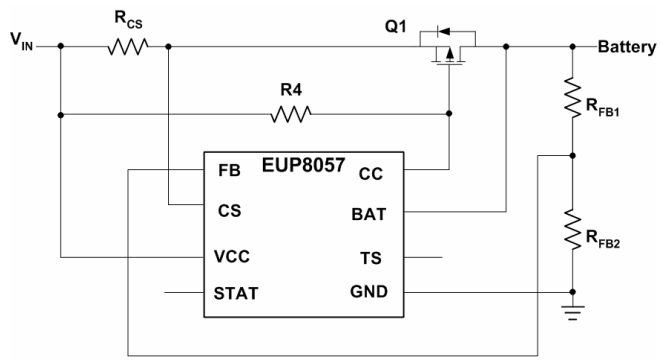

Figure8. For FB pin Function

$$V_{O(REG)} = 4.3 \times \left(1 + \frac{R_{FB1}}{R_{FB2}}\right)V$$

**Charge Termination and Recharge**

The EUP8057 monitors the charging current during the voltage-regulation phase. The EUP8057 declares a done condition and terminates charge when the current drops to the charge termination threshold,  $I_{(TERM)}$ . A new charge cycle begins when the battery voltage falls below the  $V_{(RCH)}$  threshold.

**Battery Temperature Monitoring**

The EUP8057 continuously monitors temperature by measuring the voltage between the TS and VSS pins. A negative-or a positive-temperature coefficient thermistor (NTC, PTC) and an external voltage divider typically develop this voltage (See Figure9). The EUP8057 compares this voltage against its internal  $V_{(TS1)}$  and  $V_{(TS2)}$  thresholds to determine if charging is allowed. (See Figure10). The temperature sensing circuit is immune to any fluctuation in VCC, since both the external voltage divider and the internal thresholds ( $V_{(TS1)}$  and  $V_{(TS2)}$ ) are referenced to VCC.

The resistor values of  $R_{(T1)}$  and  $R_{(T2)}$  are calculated by the following equations:

For NTC Thermistors

$$R_{T1} = \frac{5 \times R_{TH} \times R_{TC}}{3 \times (R_{TC} - R_{TH})} \text{ ----- (3)}$$

$$R_{T2} = \frac{5 \times R_{TH} \times R_{TC}}{[(2 \times (R_{TC})) - (7 \times R_{TH})]} \text{ ----- (4)}$$

For PTC Thermaistors

$$R_{T1} = \frac{5 \times R_{TH} \times R_{TC}}{3 \times (R_{TH} - R_{TC})} \text{ ----- (5)}$$

$$R_{T2} = \frac{5 \times R_{TH} \times R_{TC}}{[(2 \times (R_{TH})) - (7 \times R_{TC})]} \text{ ----- (6)}$$

Where  $R_{(TC)}$  is the cold temperature resistance and  $R_{(TH)}$  is the hot temperature resistance of thermistor, as specified by the thermistor manufacturer.

$R_{T1}$  or  $R_{T2}$  can be omitted if only one temperature (hot or cold) setting is required. Applying a voltage between the  $V_{(TS1)}$  and  $V_{(TS2)}$  thresholds to pin TS disables the temperature-sensing feature.

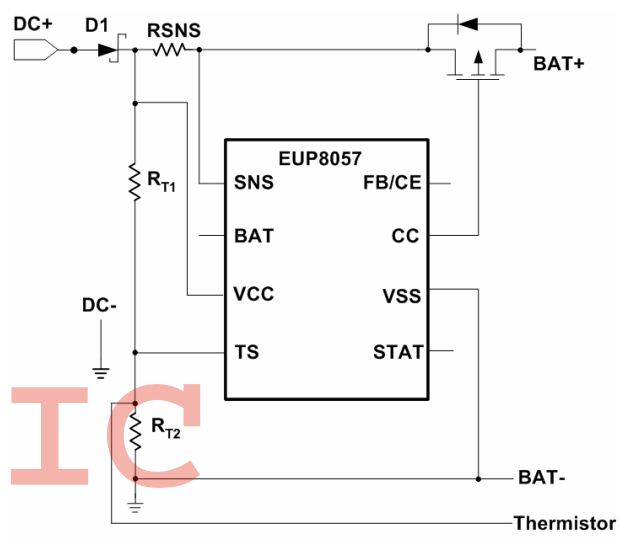

Figure9. Temperature Sensing Circuits

Figure10. EUP8057 TS Input Thresholds

**Charge Inhibit Function**

The TS pin can be used as charge-inhibit input. The user can inhibit charge by connecting the TS pin to VCC or VSS (or any level outside the  $V_{(TS1)}$  to  $V_{(TS2)}$  thresholds). Applying a voltage between the  $V_{(TS1)}$  and  $V_{(TS2)}$  thresholds to pin TS returns the charger to normal operation.

**Charge Status Indication**

The EUP8057 reports the status of the charger on the 3-state STAT pin. The following table summarized the operation of the STAT pin.

Condition	STAT pin
Battery conditioning and charging	High
Charge complete(done)	Low
Temperature fault or sleep mode	Hi-Z

The STAT pin can be used to drive a single LED (Figure1), dual-chip LEDs (Figure2) or for interface to a host or system processor (Figure11). When interfacing the EUP8057 to a processor, the user can use an output port, to recognize the high-Z state of the STAT pin. In this configuration, the user needs to read the input pin, toggle the output port and read the STAT pin again. In a high-Z condition, the input port always matches the signal level on the output port.

Figure11. Interfacing the EUP8057 to a Host Processor

**Low-Power Sleep Mode**

When the input supply is disconnected, the charger automatically enters power-saving sleep mode.

This feature prevents draining the battery pack during the absence of VCC.

**Selecting Input Capacitor**

In most applications, all that is needed is high-frequency decoupling capacitor. A 0.1μF ceramic, placed in proximity to VCC and VSS pins, works well. The EUP8057 works with both regulated and unregulated external dc supplies. If a non-regulated supply is chosen, the supply unit should have enough capacitance to hold up the supply voltage to the minimum required input voltage at maximum load. If not, more capacitance must be added to the input of the charger.

**Selecting Output Capacitor**

The EUP8057 does not require any output capacitor for loop stability.

In order to maintain good AC stability in the Constant Voltage mode, a minimum capacitance of 10μF is recommended to bypass the  $V_{BAT}$  pin to  $V_{SS}$ . This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during Constant Voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

Virtually any good quality output filter capacitor can be used, independent of the capacitor’s minimum ESR (Effective Series Resistance) value. The actual value of the capacitor and its associated ESR depends on the forward transconductance (gm) and capacitance of the external pass transistor. A 10μF tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability for up to a 1A output current.

**Selecting An External Pass-Device (PMOS or PNP)**

The EUP8057 is designed to work with both P-channel MOSFET or PNP transistor. The device should be chosen to handle the required power dissipation, given the circuit parameters, PCB layout and heat sink configuration. The following examples illustrate the design process for PMOS device:

**P-Channel MOSFET**

Selection steps for a P-channel MOSFET: We will use the following conditions:  $V_I=5V$  (with 10% supply tolerance);  $I_{(REG)}=1A$ , 4.2-V single-cell Li-Ion (EUP8057-4.2).  $V_I$  is the input voltage to the charger and  $I_{(REG)}$  is the desired charge current. (See Figure2)

1. Determine the maximum power dissipation,  $P_D$ , in the transistor.

The worst case power dissipation happens when the cell voltage,  $V_{(constant)}$ , is at its lowest (typically 3.1V at the beginning of current regulation phase) and  $V_I$  is at its maximum. Where  $V_D$  is the forward voltage drop across the reverse-blocking diode (if one is used), and  $V_{CS}$  is the voltage drop across the current sense resistor.

$$P_D=(V_{I(MAX)} - V_D - V_{CS} - V_{BAT}) \times I_{REG} \text{ ----- (7)}$$

$$P_D=(5.5 - 0.4 - 0.2 - 3.1) \times 1A$$

$$P_D=1.8W$$

2. Determine the package size needed in order to keep the junction temperature below the manufacturer’s recommended value,  $T_{JMAX}$ . Calculate the total theta,  $\theta(^{\circ}C/W)$ , needed.

$$\theta_{JA} = \frac{(T_{max(J)} - T_{A(max)})}{P_D} \text{ -----(8)}$$

$$\theta_{JA} = \frac{(150 - 40)}{1.8} \quad \theta_{JA} = 61^{\circ}C/W$$

It is recommended to choose a package with a lower  $\theta_{JA}$  than the number calculated above.

3. Select a drain-source voltage,  $V_{(DS)}$ , rating greater than the maximum input voltage. A 12V device will be adequate in this example.
4. Select a device that has at least 50% higher drain current ( $I_D$ ) rating than the desired charge current  $I_{(REG)}$ .
5. Verify that the available drive is large enough to supply the desired charge current.

$$V_{(GS)}=(V_D+V_{(CS)}+V_{OL(CC)}) - V_{I(min)} \text{ ----- (9)}$$

$$V_{(GS)}=(0.4+0.2+1) - 4.5$$

$$V_{(GS)}=-2.9$$

Where  $V_{(GS)}$  is the gate-to-source voltage,  $V_D$  is the forward voltage drop across the reverse-blocking diode (if one is used), and  $V_{CS}$  is the voltage drop across the current sense resistor, and  $V_{OL(CC)}$  is the CC pin output low voltage specification for the EUP8057.

Select a MOSFET with gate threshold voltage,  $V_{(Gsth)}$ , rating less than the calculated  $V_{(GS)}$ .

**Reverse Blocking Protection**

The optional reverse-blocking protection diode, depicted in Figure1&2 provides protection from a faulted or shorted input, or from a reversed-polarity input source. Without the protection diode, a faulted or shorted input would discharge the battery pack through the body diode of the external pass transistor.

If a reverse-protection diode is incorporated in the design, it should be chosen to handle the fast charge current continuously at the maximum ambient temperature. In addition, the reverse-leakage current of the diode should be kept as small as possible.

Packaging Information

8-Pin MSOP

NOTE

1. Package body sizes exclude mold flash and gate burrs
2. Dimension L is measured in gage plane
3. Tolerance 0.10mm unless otherwise specified
4. Controlling dimension is millimeter. Converted inch dimensions are not necessarily exact.
