

PM150RL1A120FLAT-BASE TYPE
INSULATED PACKAGE**PM150RL1A120****FEATURE**

Inverter + Brake + Drive & Protection IC

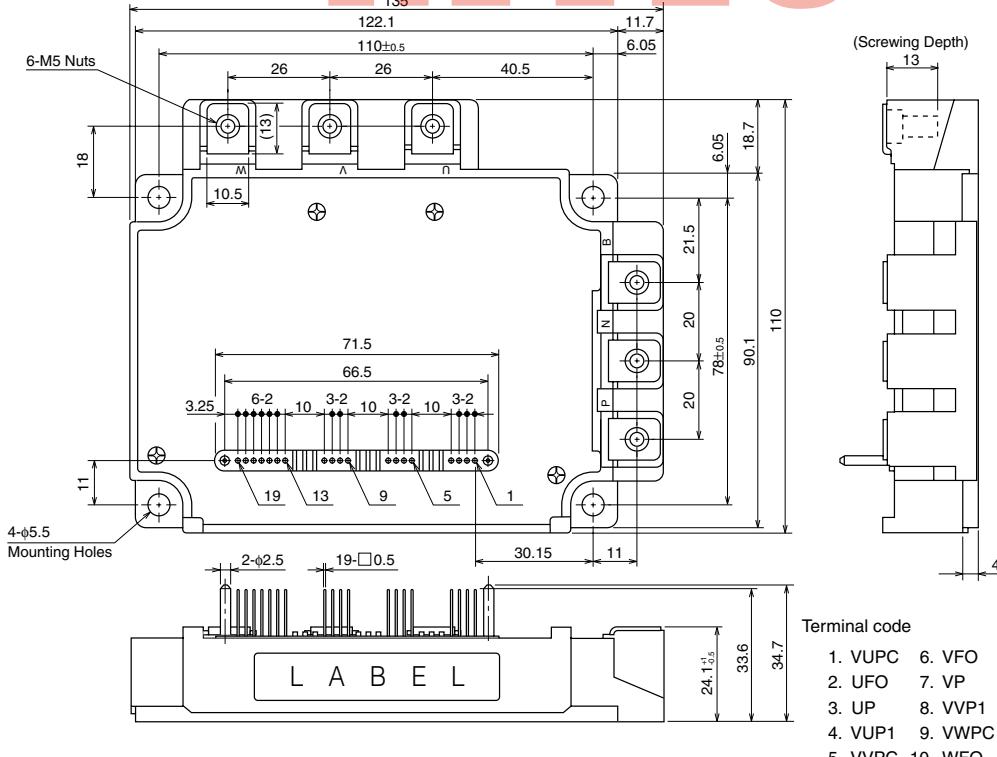

- a) Adopting new 5th generation Full-Gate CSTBT™ chip
 - b) The over-temperature protection which detects the chip surface temperature of CSTBT™ is adopted.
 - c) Error output signal is possible from all each protection upper and lower arm of IPM.
 - d) Compatible L-series package.
- 3φ 150A, 1200V Current-sense and temperature sense IGBT type inverter
 - Monolithic gate drive & protection logic
 - Detection, protection & status indication circuits for, short-circuit, over-temperature & under-voltage (P-Fo available from upper arm devices)
 - UL Recognized

APPLICATION

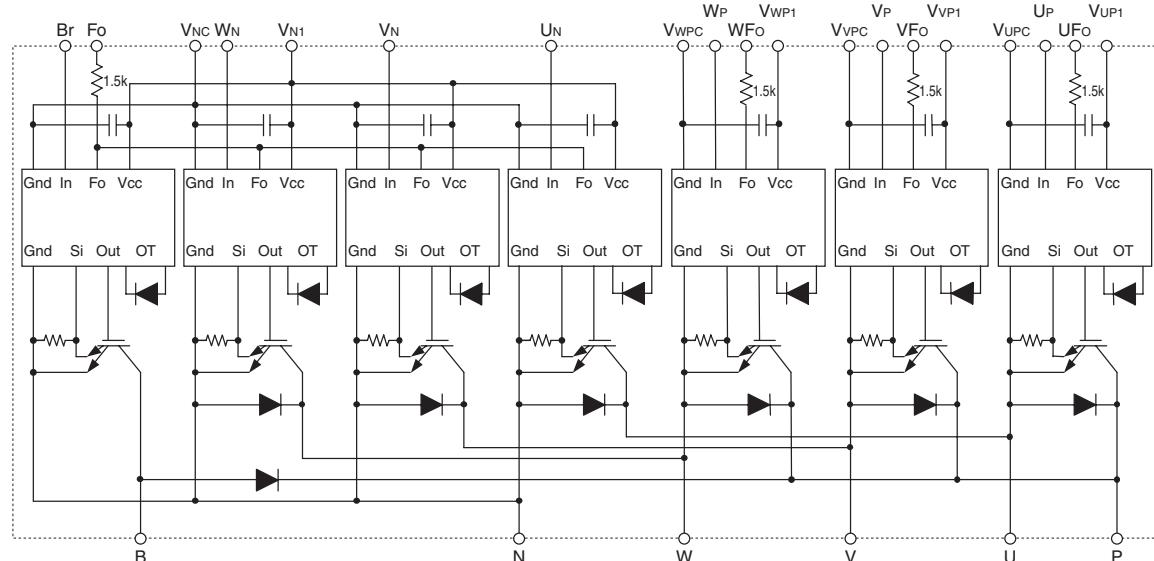

General purpose inverter, servo drives and other motor controls

PRECAUTIONS FOR TESTING

- Before applying any control supply voltage (V_D), the input terminals should be pulled up by resistors, etc. to their corresponding supply voltage and each input signal should be kept off state.
After this, the specified ON and OFF level setting for each input signal should be done.
- When performing "SC" tests, the turn-off surge voltage spike at the corresponding protection operation should not be allowed to rise above V_{CES} rating of the device.
(These test should not be done by using a curve tracer or its equivalent.)

NOTES FOR STABLE AND SAFE OPERATION ;

- Design the PCB pattern to minimize wiring length between opto-coupler and IPM's input terminal, and also to minimize the stray capacity between the input and output wirings of opto-coupler.
- Connect low impedance capacitor between the Vcc and GND terminal of each fast switching opto-coupler.
- Fast switching opto-couplers: $t_{PLH}, t_{PHL} \leq 0.8\mu s$, Use High CMR type.
- Slow switching opto-coupler: $CTR > 100\%$
- Use 4 isolated control power supplies (V_D). Also, care should be taken to minimize the instantaneous voltage change of the power supply.
- Make inductance of DC bus line as small as possible, and minimize surge voltage using snubber capacitor between P and N terminal.
- Use line noise filter capacitor (ex. $4.7nF$) between each input AC line and ground to reject common-mode noise from AC line and improve noise immunity of the system.
